CTPIP - How to Run

Quick reference. Full details: 01_User_Manual.pdf.

1. One-Time Setup

- Install Python 3.11+ (tick Add to PATH), Node.js LTS and Neo4j Desktop. Optional for AI: Ollama (ollama.com).
- Open the project folder (the one containing `start.bat`).
- Create the settings file: `Copy-Item .env.example .env`
- In Neo4j Desktop create a Local instance, set a password, note its folder and its Java 21 folder.
- Edit `.env`: set `NEO4J_PASSWORD`, `NEO4J_HOME`, `NEO4J_JAVA_HOME`.

2. Start

- Double-click `start.bat` (or run `.\start.bat` in PowerShell from the project folder).
- It starts Neo4j and Ollama, offers to download the AI model (press Y; about 2 GB), picks a free port and opens the browser.
- First start: the 190 dataset PDFs are read automatically (about 30-60 minutes; the app is usable meanwhile).
- Keep the Neo4j and backend windows open. The menu bottom shows **Database online** and **Local AI** with the model name.

3. Use

1. Protocols: press **Study** on any protocol for a plain-language overview, an AI explanation and Q&A.;
2. Ask AI: ask about one or all protocols (Quick answer or Research agent). Every answer shows its sources.
3. Search and Compare: switch on **Explain with local AI** to get results explained in plain language.
4. Citation chips: blue `S3` = cited source; dashed `~S3` = matched automatically. Check the explainability box and the page links.

4. Stop

- Press **Ctrl+C** in the backend window and in the Neo4j window. Data is kept; run `start.bat` again any time.

5. Quick Fixes

- `[!] .env missing`: create `.env` from `.env.example`. Neo4j not online: check the Neo4j paths and password in `.env`.
- Local AI not ready: start Ollama, then on Settings download/choose a model and press Save.
- Another program uses port 8000: start.bat uses the next free port and prints the address. Failed protocol: press its retry button.
